1. Overview

1.1 Purpose

The Digital Initiatives Platform is a centralized internal portal that enables product teams, operations managers, and other stakeholders to discover all available digital initiatives and APIs, view partner integrations for each initiative, review commercial terms and documentation, and access implementation details without depending on the central technology team.

1.2 Problem Statement

- Knowledge about digital initiatives, vendor partners, and commercial terms is fragmented across teams and documents.
- Stakeholders depend on the technology team for answers on pricing, API documentation, contacts, and product mapping.
- There is no single source of truth for which vendors power which journeys and products.

1.3 Goals

- Provide a self-service discovery portal for initiatives, partners, commercials, and API documentation.
- Give admins full control over content through a management console.
- Support discovery both by customer journey and by business product.

1.4 Success Metrics

- 100% of digital initiatives and partners managed through the platform.
- Reduction in ad-hoc information requests to the technology team.
- Stakeholders can independently find initiative, partner, commercial, and API details.

2. Users & Roles

Role	Access	Capabilities
Admin	Portal + Admin console	Full create/edit/delete of buckets, categories, initiatives, partners, products, and all partner details
User	Portal (view-only)	Browse and search all initiatives, partners, commercials, documentation, and media

Access can be restricted to a specific corporate email domain (configurable via a single constant in the signup flow).

3. Information Architecture

The platform uses a three-level hierarchy to organize all content:

- Bucket (top level): A broad business grouping, e.g. Onboarding.
- Category (main category): A functional grouping inside a bucket, e.g. Workflow Automation.
- Initiative (subcategory): An individual digital initiative, e.g. VKYC, Lead Gen Bot.

Partners are attached to initiatives, and each partner is mapped to the products it is live with. This enables two discovery modes on the home page: Journey-wise (Bucket > Category > Initiative) and Product-wise (Product first, then the same hierarchy filtered to that product).

4. Functional Requirements

4.1 Portal - Discovery & Navigation

- Card-based home page with a toggle between Journey-wise and Product-wise views.
- Journey view: drill down from buckets to categories to initiatives with breadcrumb navigation.
- Product view: pick a product first, then see only the buckets, categories, initiatives, and partners linked to that product.
- Initiatives with no partners are displayed at the bottom of listings.
- Search and filtering of initiatives.
- Browser back/forward preserves drill-down position via URL state.

4.2 Portal - Initiative Detail

- Initiative overview with description and status.
- Partner list for the initiative, sorted and badged by priority (Primary, Secondary, etc.).
- Optional product filter (carried from Product-wise view) to show only partners linked to the selected product.
- Partner comparison matrix shown when two or more partners exist.
- Partner deep-dive with tabbed sections, each shown only when content exists:
- Commercials: price, pricing unit, currency, SLA, terms and conditions.
- API Documentation: formatted documentation with endpoints, authentication, and rate limits.
- Media: embedded video tutorials and documentation files.
- Products: products the partner is live with, including usage status, implementation date, and notes.
- Support: production and sandbox contacts, support hours, known issues, FAQs.
- API Keys (optional): UAT and Production keys, visible only when provided.
- Request/Response samples (optional): sample API request and response payloads.

4.3 Admin Console

- Dashboard with counts and quick actions.
- Buckets management: create, edit, delete top-level buckets.
- Categories management: create, edit, delete categories, each assigned to a bucket.
- Initiatives management: create, edit, delete initiatives, each assigned to a category; logo upload; status toggle.
- Partners management: global partner directory with contact details.
- Initiative-partner configuration: link a partner to an initiative and manage all per-initiative details (commercials, API documentation, media, product mapping, support, API keys, request/response samples, and partner priority ranking).
- Products management: add, edit, delete, and reorder the product catalog used for partner-product mapping.

4.4 Content & Media

- Partner media support for videos and documents in a secure player/viewer.

- Media uploads limited to 100MB with private storage and signed URLs.
- Logo/image uploads for initiatives and partners.

5. Data Model

Entity	Key Fields	Notes
initiatives	id, name, description, parent_id, level (bucket/category/initiative), status, logo	Self-referencing table implementing the 3-level hierarchy; a database trigger enforces valid parent-child levels
partners	id, name, website, logo, type, status, contact details	Global partner directory
initiative_partners	initiative_id, partner_id, price, pricing_unit, currency, sla, terms, api_documentation, video, uat_api_key, production_api_key, api_request_sample, api_response_sample, partner_rank	Junction table holding all per-initiative partner details; partner_rank drives Primary/Secondary labeling
initiative_partner_products	initiative_partner_id, product_id, usage_status, implementation_date, notes	Maps partners to the products they are live with; powers the Product-wise view
products	id, name, description, category, is_active, display_order	Admin-managed product catalog
api_documents	initiative_partner_id, version, spec, input/output parameters	Versioned API specifications
partner_media	initiative_partner_id, type, path, title, duration	Videos and documents for partners
user_roles	user_id, role (admin/user)	Role-based access control

6. Non-Functional Requirements

6.1 Security

- Email/password authentication with role-based access control.
- Optional email-domain restriction for signup (single configuration constant).
- Row-level security on all database tables; private media storage with signed URLs.
- API keys are entered by admins only and displayed only to authenticated users.

6.2 Usability & Design

- Modern, professional enterprise UI: sidebar navigation, clean card layouts, consistent typography.
- Neutral branding: all organization-specific branding is replaced with placeholders for easy re-theming.
- Responsive across desktop and tablet.

6.3 Performance & Reliability

- Client-side data fetching with caching for snappy navigation.
- Signed media URLs generated on demand; 100MB upload ceiling.

7. Scope

7.1 In Scope (Delivered)

- Discovery portal with Journey-wise and Product-wise modes.
- Three-level hierarchy (Bucket > Category > Initiative) with enforced integrity.
- Partner deep-dives with commercials, documentation, media, products, support, API keys, and request/response samples.
- Partner priority ranking and comparison matrix.
- Full admin console including product catalog management.

7.2 Future Enhancements (Phase 2+)

- API testing sandbox with sample requests and live response logging.
- Documentation export (PDF, Postman collection, Markdown).
- Notifications for new initiatives and documentation updates.
- Analytics: most-viewed initiatives, popular partners, coverage analysis.
- Version history and rollback for API documentation.
- Full-text search across documentation.

8. Acceptance Criteria

- Admins can manage buckets, categories, initiatives, partners, products, and all partner details end to end.
- Users can browse both Journey-wise and Product-wise views and reach any partner detail without assistance.
- Optional sections (API Keys, Request/Response) appear only when populated by an admin.
- Partner priority (Primary/Secondary) set in admin is reflected in portal ordering and badges.
- Initiatives without partners sort to the bottom of listings.
- Back navigation preserves the user's position in the drill-down.
- No organization branding is hardcoded; placeholders are used throughout.
